- 1.
- 2.
- 3.
- 4.
5. $K_c = 62.1$, $z_{lead} = 6$, $p_{lead} = 15.51$
- 6.
- 7.
8. poles at $-6 \pm 15j$
9. We can choose values of z_{lag} and p_{lag} that are near the origin. This would not affect the transient performance of the closed loop very much as the transient responses of the zero and pole would decay very quickly.
- 10.
